

# Chapter 11: Rolling, Torque, and Angular Momentum

- For an object rolling smoothly, the motion of the center of mass is pure translational.

$$s = \theta R \quad v_{\text{com}} = ds/dt = d(\theta R)/dt = \omega R$$

$$v_{\text{com}} = \omega R$$

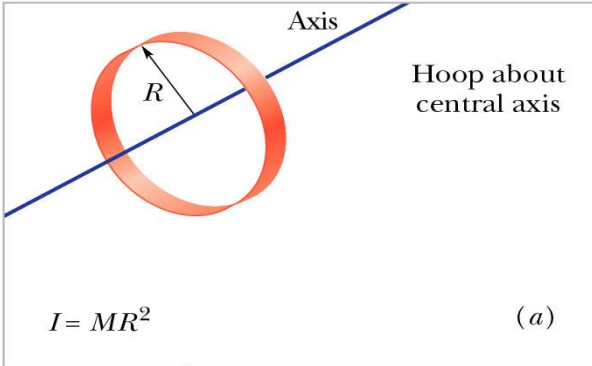

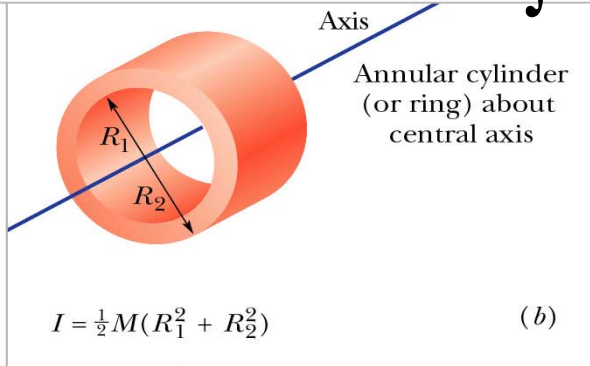

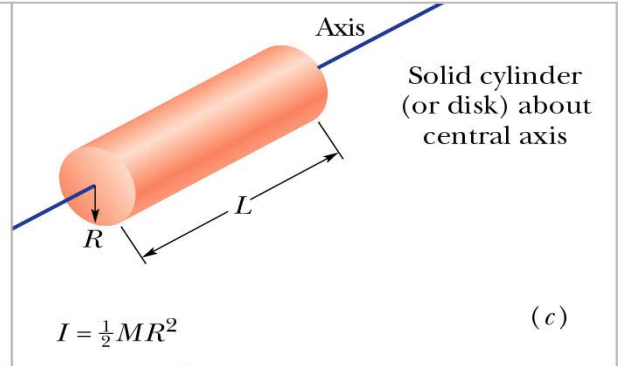

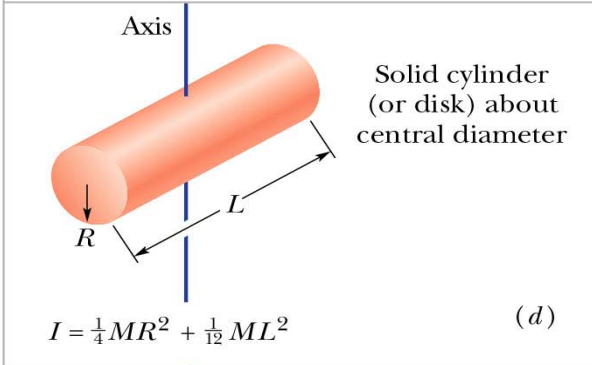

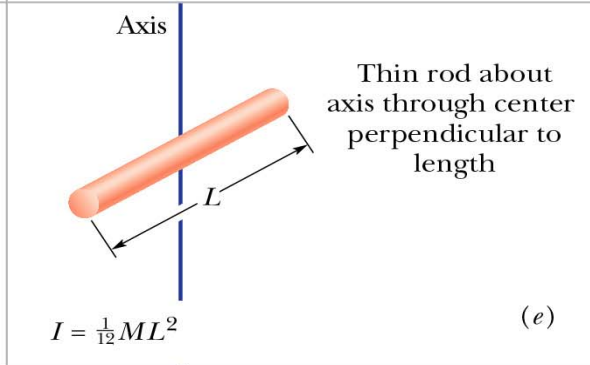

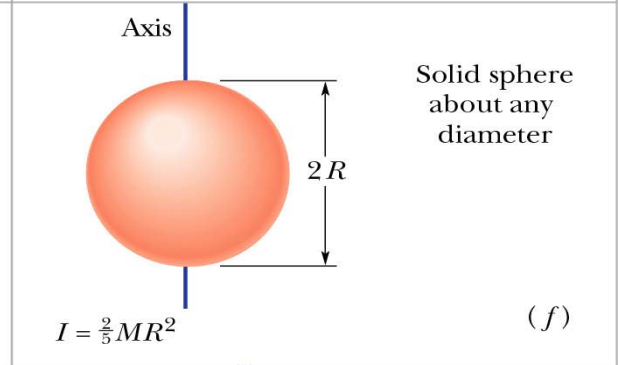

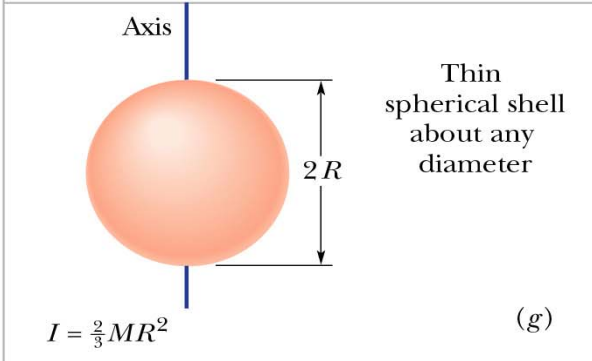

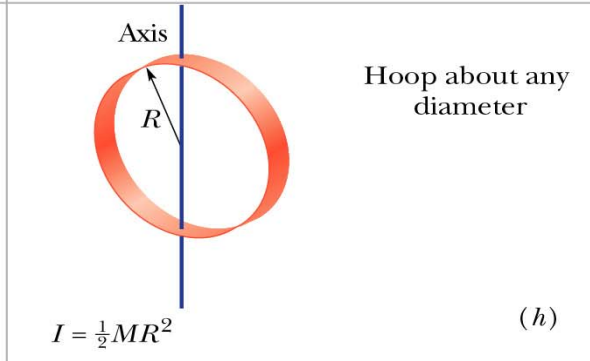

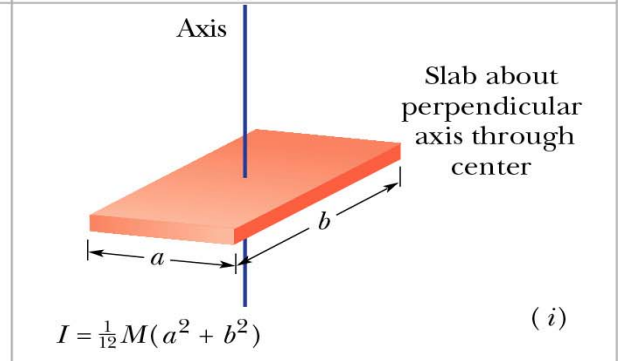

- Rolling viewed as a combination of pure rotation and pure translation

- Rolling viewed as pure rotation  
 $v_{\text{top}} = (\omega)(2R) = 2 v_{\text{com}}$
- Different views, same conclusion

- Rotational inertia involves not only the mass but also the distribution of mass for continuous masses
- Calculating the rotational inertia  $I = \int r^2 dm$

# The Kinetic Energy of Rolling

View the rolling as pure rotation around  $P$ , the kinetic energy

$$K = \frac{1}{2} I_P \omega^2$$

parallel axis theorem:  $I_P = I_{\text{com}} + MR^2$

so 
$$K = \frac{1}{2} I_{\text{com}} \omega^2 + \frac{1}{2} MR^2 \omega^2$$

since  $v_{\text{com}} = \omega R$

$$K = \frac{1}{2} I_{\text{com}} \omega^2 + \frac{1}{2} M(v_{\text{com}})^2$$

$\frac{1}{2} I_{\text{com}} \omega^2$  : due to the object's rotation about its center of mass

$\frac{1}{2} M(v_{\text{com}})^2$  : due to the translational motion of its center of mass

Sample Problem: A uniform solid cylindrical disk, of mass  $M = 1.4 \text{ kg}$  and radius  $R = 8.5 \text{ cm}$ , rolls smoothly across a horizontal table at a speed of  $15 \text{ cm/s}$ . What is its kinetic energy  $K$ ?

$$v_{\text{c.m.}} = 0.15 \text{ m/s}$$

$$I_{\text{disk}} = \frac{1}{2}MR^2 = (0.5)(1.4\text{kg})(0.085\text{m})^2 = 5.058 \times 10^{-3} \text{ kg m}^2$$

$$\omega = v/R = (0.15\text{m/s})/0.085\text{m} = 1.765 \text{ rad/s}$$

$$K = K_{\text{trans}} + K_{\text{rot}} = \frac{1}{2}Mv_{\text{c.m.}}^2 + \frac{1}{2}I\omega^2$$

$$\begin{aligned} K &= K_{\text{trans}} + K_{\text{rot}} = \frac{1}{2}(1.4)(0.15)^2 + \frac{1}{2}(5.058 \times 10^{-3})(1.765)^2 \\ &= 15.75 \times 10^{-3} + 7.878 \times 10^{-3} = 23.63 \times 10^{-3} \text{ J} \end{aligned}$$

# Vector Product (Review)

- Vector product of vectors  $\vec{a}$  and  $\vec{b}$  produce a third vector  $\vec{c}$  whose magnitude is

$$c = a b \sin \phi$$

whose direction follow the right hand rule

if  $\vec{a}$  and  $\vec{b}$  parallel  $\Rightarrow \vec{a} \times \vec{b} = 0$

if  $\vec{a}$  and  $\vec{b}$  perpendicular  $\Rightarrow \vec{a} \times \vec{b} = ab$

$$\vec{i} \times \vec{i} = 0 \quad \vec{i} \times \vec{j} = \vec{k}$$

Note:  $\vec{a} \times \vec{b} = -(\vec{b} \times \vec{a})$

(a)

(b)

# Torque revisited

- For a fixed axis rotation, torque  $\tau = r F \sin\theta$
- Expand the definition to apply to a particle that moves along any path relative to a fixed point.

$$\vec{\tau} = \vec{r} \times \vec{F}$$

- direction : right-hand rule
- magnitude :  $\tau = rF \sin \Phi = rF_{\perp} = r_{\perp}F$

# Angular momentum

- Angular momentum with respect to point O for a particle of mass  $m$  and linear momentum  $p$  is defined as

$$\vec{\ell} = \vec{r} \times \vec{p} = m (\vec{r} \times \vec{v})$$

direction: right-hand rule

magnitude:

$$\ell = r p \sin \phi = r m v \sin \phi$$

- Compare to the linear case  $\vec{p} = m\vec{v}$

Particles 1, 2, 3, 4, 5 have the same mass and speed as shown in the figure. Particles 1 & 2 move around  $O$  in opposite directions. Particles 3, 4, and 5 move towards or away from  $O$  as shown.

(a)

(b)

Which of the particles has the greatest magnitude angular momentum?

Particles 1, 2, 3, 4, 5 have the same mass and speed as shown in the figure. Particles 1 & 2 move around  $O$  in opposite directions. Particles 3, 4, and 5 move towards or away from  $O$  as shown.

(a)

(b)

$$\ell = r p \sin \phi = r m v \sin \phi \quad \phi = 90^\circ \text{ only for 1 and 2, but } r_1 = 2r_2.$$

Which of the particles has the greatest magnitude angular momentum?

- 1) 1    2) 2    3) 3    4) 4    5) 5    6) all have the same  $l$

# Newton's Second Law in Angular Form

$$\vec{\tau}_{net} = \frac{d\vec{l}}{dt}$$

- $\vec{\tau}_{net}$  : the vector sum of all the torques acting on the object

- Comparing to the linear case:  $\vec{F}_{net} = \frac{d\vec{p}}{dt}$

- Newton's 2<sup>nd</sup> law for a system of particles

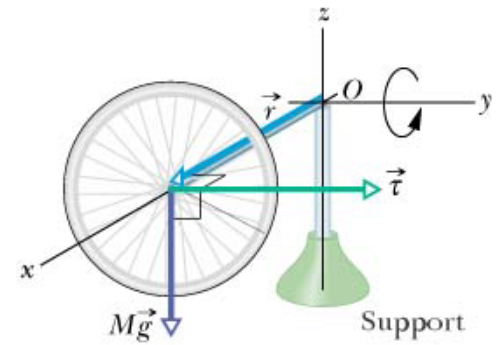

$$\vec{\tau}_{net} = \frac{d\vec{L}_{total}}{dt} \quad \vec{L}_{total} = \sum_{i=1}^n \vec{l}_i$$

- Net external torque equals to the time rate change of the system's total angular momentum

# Torque and Angular Momentum

$$\begin{aligned}\vec{\tau}_{\text{net}} &= \frac{d\vec{L}}{dt} = \frac{d(\vec{r} \times m\vec{v})}{dt} \\ &= \vec{r} \times \left( m \frac{d\vec{v}}{dt} \right) = \vec{r} \times (m\vec{a}) = \vec{r} \times \vec{F}\end{aligned}$$

Torque is the time rate of change of angular momentum.

(a)

(b)

(c)

# A Quiz

Particles 1, 2, 3, 4, 5 have the same mass and speed as shown in the figure. Particles 1 & 2 move around  $O$  in opposite directions. Particles 3, 4, and 5 move towards or away from  $O$  as shown.

(a)

(b)

Which of the particles has the smallest magnitude angular momentum?

- 1) 1    2) 2    3) 3    4) 4    5) 5    6) all have the same  $l$

# A Quiz

Particles 1, 2, 3, 4, 5 have the same mass and speed as shown in the figure. Particles 1 & 2 move around  $O$  in opposite directions. Particles 3, 4, and 5 move towards or away from  $O$  as shown.

(a)

(b)

$$l = r p \sin \phi = r m v \sin \phi$$

$$\phi = 0^\circ \text{ for } 5. \Rightarrow l = 0$$

Which of the particles has the smallest magnitude angular momentum?

- 1) 1    2) 2    3) 3    4) 4    5) 5    6) all have the same  $l$

# The angular momentum of a rigid body rotating about a fixed axis

- Consider a simple case, a mass  $m$  rotating about a fixed axis  $z$ :

$$l = r m v \sin 90^\circ = r m r \omega = m r^2 \omega = I \omega$$

- In general, the angular momentum of rigid body rotating about a fixed axis is

$$\mathbf{L} = I \boldsymbol{\omega}$$

$L$  : angular momentum along the rotation axis

$I$  : moment of inertia about the same axis

# Conservation of Angular Momentum

- If the net external torque acting on a system is zero, the angular momentum of the system is conserved.

$$\text{if } \vec{\tau}_{net} = \frac{d\vec{L}}{dt} \quad \vec{\tau}_{net} = \mathbf{0} \quad \text{then } \vec{L} = \text{const}$$

- If  $\tau_{net, z} = 0$  then  $L_{i, z} = L_{f, z}$        $\vec{L}_i = \vec{L}_f$
- For a rigid body rotating around a fixed axis, ( $L = I \omega$ ) the conservation of angular momentum can be written as

$$I_i \omega_i = I_f \omega_f$$

# Some examples involving conservation of angular momentum

- The spinning volunteer

$$I_i \omega_i = I_f \omega_f$$

# Angular momentum is conserved

$L_i$  is in the spinning wheel

Now exert a torque to flip its rotation.

$$L_{f, \text{ wheel}} = -L_i.$$

Conservation of Angular momentum means that the person must now acquire an angular momentum.

$$L_{f, \text{ person}} = +2L_i$$

$$\text{so that } L_f = L_{f, \text{ person}} + L_{f, \text{ wheel}} = +2L_i + -L_i = L_i.$$

## Problem 11-66

Ring of  $R_1 (=R_2/2)$  and  $R_2 (=0.8\text{m})$ ,  
Mass  $m_2 = 8.00\text{kg}$ .  
 $\omega_i = 8.00\text{ rad/s}$ . Cat  $m_1 = 2\text{kg}$ . Find  
kinetic energy change when cat walks  
from outer radius to inner radius.

### Initial Momentum

$$\begin{aligned} L_i &= L_{i,\text{cat}} + L_{i,\text{ring}} = m_1 R_2 v_i + I \omega_i \\ &= m_1 R_2^2 \omega_i + \frac{1}{2} m_2 (R_1^2 + R_2^2) \omega_i \\ &= m_1 R_2^2 \omega_i \left( 1 + \frac{1}{2} \frac{m_2}{m_1} \left( \frac{R_1^2}{R_2^2} + 1 \right) \right) \end{aligned}$$

## Problem 11-66

Ring of  $R_1 (=R_2/2)$  and  $R_2 (=0.8\text{m})$ ,  
Mass  $m_2 = 8.00\text{kg}$ .  
 $\omega_i = 8.00 \text{ rad/s}$ . Cat  $m_1 = 2\text{kg}$ . Find  
kinetic energy change when cat walks  
from outer radius to inner radius.

## Problem 11-66

Ring of  $R_1 (=R_2/2)$  and  $R_2 (=0.8\text{m})$ ,

Mass  $m_2 = 8.00\text{kg}$ .

$\omega_i = 8.00 \text{ rad/s}$ . Cat  $m_1 = 2\text{kg}$ . Find kinetic energy change when cat walks from outer radius to inner radius.

### Final Momentum

$$\begin{aligned} L_f &= L_{f,\text{cat}} + L_{f,\text{ring}} = m_1 R_1 v_f + I \omega_f \\ &= m_1 R_1^2 \omega_f + \frac{1}{2} m_2 (R_1^2 + R_2^2) \omega_f \\ &= m_1 R_1^2 \omega_f \left( 1 + \frac{1}{2} \frac{m_2}{m_1} \left( \frac{R_2^2}{R_1^2} + 1 \right) \right) \end{aligned}$$

## Problem 11-66

Then from  $L_f = L_i$  we obtain

$$\frac{\omega_f}{\omega_0} = \frac{R_2^2 \left( 1 + \frac{1}{2} \frac{m_2}{m_1} \left( \frac{R_1^2}{R_2^2} + 1 \right) \right)}{R_1^2 \left( 1 + \frac{1}{2} \frac{m_2}{m_1} \left( 1 + \frac{R_2^2}{R_1^2} \right) \right)} = (2.0)^2 \frac{1 + 2(0.25 + 1)}{1 + 2(1 + 4)} = 1.273$$

Thus,  $\omega_f = 1.273\omega_0$ . Using  $\omega_0 = 8.00$  rad/s, we have  $\omega_f = 10.2$  rad/s. By substituting  $I = L/\omega$  into  $K = \frac{1}{2} I \omega^2$ , we obtain  $K = \frac{1}{2} L \omega$ . Since  $L_i = L_f$ , the kinetic energy ratio becomes

$$\frac{K_f}{K_i} = \frac{\frac{1}{2} L_f \omega_f}{\frac{1}{2} L_i \omega_i} = \frac{\omega_f}{\omega_0} = 1.273.$$

which implies  $\Delta K = K_f - K_i = 0.273K_i$ . The cat does positive work while walking toward the center of the ring, increasing the total kinetic energy of the system.

## Problem 11-66

Ring of  $R_1 (=R_2/2)$  and  $R_2 (=0.8\text{m})$ ,  
Mass  $m_2 = 8.00\text{kg}$ .  
 $\omega_i = 8.00 \text{ rad/s}$ . Cat  $m_1 = 2\text{kg}$ . Find  
kinetic energy change when cat walks  
from outer radius to inner radius.

Initial Kinetic energy  $K_i$  is:

$$\begin{aligned} K_i &= \frac{1}{2} \left[ m_1 R_2^2 + \frac{1}{2} m_2 (R_1^2 + R_2^2) \right] \omega_0^2 = \frac{1}{2} m_1 R_2^2 \omega_0^2 \left[ 1 + \frac{1}{2} \frac{m_2}{m_1} \left( \frac{R_1^2}{R_2^2} + 1 \right) \right] \\ &= \frac{1}{2} (2.00 \text{ kg})(0.800 \text{ m})^2 (8.00 \text{ rad/s})^2 [1 + (1/2)(4)(0.5^2 + 1)] \\ &= 143.36 \text{ J}, \end{aligned}$$

the increase in kinetic energy is  $\Delta K = (0.273)(143.36 \text{ J}) = 39.1 \text{ J}$ .
