## Chapter 5 Force and Motion

- Force F
- is the interaction between objects
- is a vector
- causes acceleration
- Net force: vector sum of all the forces on an object.
$\overrightarrow{\mathrm{F}}_{\text {total }} \equiv \overrightarrow{\mathrm{F}}_{\mathrm{net}}=\sum_{\mathrm{i}=1}^{\mathrm{N}} \overrightarrow{\mathrm{F}}_{\mathrm{i}}=\overrightarrow{\mathrm{F}}_{1}+\overrightarrow{\mathrm{F}}_{2}+\overrightarrow{\mathrm{F}}_{3}+\overrightarrow{\mathrm{F}}_{4}+\ldots=\mathrm{m} \overrightarrow{\mathrm{a}}$

## Force Examples

- Gravitational
- Friction
- tension
- spring
- normal
- momentum change
- electrostatic
- magnetic
- nuclear
- etc.......

## Newton's first law

- Newton's first law: If no force acts on a body, then the body's velocity cannot change, that is, the body can not accelerate
- rest, still rest
- moving, continue moving with same velocity
- Inertia reference frame is one in which Newton's laws hold

## Mass

- Definition: The mass of an object is a measure of its "resistance" to being accelerated.
- Symbol: $m$
- SI Base unit: kg (by the way, the English unit for mass is the "slug")
- Scalar quantity
- Mass is an intrinsic characteristic of an object, however its value does change at high speeds (Special Relativity) Has to do with the speed of light being $c$.

## Newton's Second Law

- Newton's second law: The net force on a body is equal to the product of the body's mass and the acceleration of the body

$$
\Sigma \overrightarrow{\mathrm{F}}=\mathrm{m} \overrightarrow{\mathrm{a}}
$$

$\Sigma \overrightarrow{\mathrm{F}}$ : vector sum of all the forces that act on that body

$$
\Sigma \mathrm{F}_{\mathrm{x}}=\mathrm{ma}_{\mathrm{x}} \quad \Sigma \mathrm{~F}_{\mathrm{y}}=\mathrm{ma}_{\mathrm{y}} \quad \Sigma \mathrm{~F}_{\mathrm{z}}=\mathrm{ma}_{\mathrm{z}}
$$

- Unit: $1 \mathrm{~N}=(1 \mathrm{~kg}) .\left(1 \mathrm{~m} / \mathrm{s}^{2}\right)=1 \mathrm{~kg} \cdot \mathrm{~m} / \mathrm{s}^{2}$
- Example: (problem 5-6 in the text book) Three astronauts, propelled by jet backpacks, push and guide a 120 kg asteroid toward a processing dock, exerting forces shown in Fig. What is the asteroid's acceleration (a) in unit vector notation and as (b)a magnitude and (c) a direction

Break problem into x - and y -components

$$
\begin{aligned}
& \overrightarrow{\mathrm{F}}_{1}=\left(41 \mathrm{~N} \cos 60^{\circ}\right) \hat{i}+\left(-41 \mathrm{~N} \sin 60^{\circ}\right) \hat{\mathrm{j}} \\
& \overrightarrow{\mathrm{~F}}_{2}=(55 \mathrm{~N}) \quad \hat{\mathrm{i}}+\quad(0) \quad \hat{\hat{j}} \\
& \overrightarrow{\mathrm{~F}}_{3}=\left(32 \mathrm{~N} \cos 30^{\circ}\right) \hat{i}+\left(32 \mathrm{~N} \sin 30^{\circ}\right) \hat{\mathrm{j}} \\
& \overrightarrow{\mathrm{~F}}_{\text {net }}=(103.2 \mathrm{~N}) \quad \hat{\mathrm{i}}+(-19.51 \mathrm{~N}) \quad \hat{\mathrm{j}}
\end{aligned}
$$

- The gravitational force near the surface of a very large object (i.e., the Earth):

$$
\mathrm{F}_{\mathrm{g}}=\mathrm{mg}
$$

- Weight (gravitational force)

$$
\mathrm{W}=\mathrm{F}_{\mathrm{g}}=\mathrm{mg}
$$

-g varies with location

- weight and mass are different, e.g. 7.2 kg ball, same mass on earth and moon, weight 71 N on earth but 12 N on the moon
- Suppose you are talking by interplanetary telephone to your friend, who lives on the moon. She tells you that he just won a piece of gold weighing one newton in a contest. Excitedly, you tell her that you entered the Earth version of the same contest and also won a newton of gold! Who is richer?
- The normal force: $\mathbf{F}_{\mathbf{N}}$
- When a body presses against a surface, the surface deforms and pushes on the body with a normal force N that is perpendicular to the surface
$-\mathbf{F}_{\mathrm{N}}$ does not always equal mg
- Friction: f
- the resistance force on a body when the body slides or attempts to slide along a surface
- Tension: T
- When a cord is attached to a body and pulled taut, the cord pulls on the body with force $T$

(a)

(b)

(c)

CP 5-5: The body in fig (c) has a weight of 75 N , Is T equal to, greater than, or less than 75 N when the body is moving upward (a) at constant speed
(b) at increasing speed
(c) at decreasing speed?

## Newton's Third Law

- Why would I feel pain if I hit the wall with my fist?
- Newton's third law: When two bodies interact, the forces on the bodies from each other are always equal in magnitude and opposite in direction

$$
\mathrm{F}_{\mathrm{AB}}=-\mathrm{F}_{\mathrm{BA}}
$$

- They do not cancel each other since they act on different bodies

If a sport car collides head-on with a massive truck,
(a) which vehicle experiences the greater force?
(b) which vehicle experience the greater acceleration?

## Remember that a modern semi-truck

 has a mass of $\mathbf{2 5}$ cars!Assume F $=20 \mathrm{~N}$, surface frictionless. What is the acceleration?

$$
\begin{aligned}
& \mathrm{F}=\left(\mathrm{m}_{1}+\mathrm{m}_{2}+\mathrm{m}_{3}+\mathrm{m}_{4}\right) \mathrm{a}=(20 \mathrm{~kg}) \mathrm{a}=20 \mathrm{~N} \\
& =\Rightarrow \mathrm{a}=20 \mathrm{~N} / 20 \mathrm{~kg}=1.0 \mathrm{~m} / \mathrm{s}^{2}
\end{aligned}
$$

How about $\mathrm{T}_{1}$ ?

$$
\mathrm{T}_{1}=\mathrm{m}_{1} \mathrm{a}=(10 \mathrm{~kg})\left(1.0 \mathrm{~m} / \mathrm{s}^{2}\right)=10 \mathrm{~N}
$$

## General scheme for solving Newton's law problems

- Isolate the objects in the problem
- For each object of interest, identify all the external forces on that object and draw a freebody diagram for this object
- establish a convenient coordinate system for each object and find the component of the forces along those axes.
- Apply Newton's $2^{\text {nd }}$ law in the x and y directions for each object. ( e.g. $\Sigma \mathrm{F}_{\mathrm{x}}=\mathrm{ma}_{\mathrm{x}}, \Sigma \mathrm{F}_{\mathrm{y}}=\mathrm{ma}_{\mathrm{y}}$ )
- Solve the resulting set of equations.

## A Quiz

Consider a traffic light of $\mathrm{m}=4 \mathrm{~kg}$ held by one rope which in turn is supported by two other ropes as shown with angles $\theta_{1}=30^{\circ} \theta_{2}=45^{\circ}$, Which of the three ropes has the greater tension?

## A Quiz

Consider a traffic light of $\mathrm{m}=4 \mathrm{~kg}$ held by one rope which in turn is supported by two other ropes as shown with angles $\theta_{1}=30^{\circ} \theta_{2}=45^{\circ}$, Which of the three ropes has the greater tension?

1) rope 1
2) rope 2
3) rope 3
4) All ropes have the same tension

## A Quiz

Consider a traffic light of $\mathrm{m}=4 \mathrm{~kg}$ held by one rope which in turn is supported by two other ropes as shown with angles $\theta_{1}=30^{\circ} \theta_{2}=45^{\circ}$, Which of the three ropes has the greater tension?

## A Quiz

Consider a traffic light of $\mathrm{m}=4 \mathrm{~kg}$ held by one rope which in turn is supported by two other ropes as shown with angles $\theta_{1}=30^{\circ} \theta_{2}=$ $45^{\circ}$, Which of the three ropes has the greater tension?
$\mathrm{F}_{\mathrm{x}}=-\mathrm{F}_{1} \cos 30^{\circ}+\mathrm{F}_{2} \cos 45^{\circ}=0$
$\mathrm{F}_{\mathrm{y}}=\mathrm{F}_{1} \sin 30^{\circ}+\mathrm{F}_{2} \sin 45^{\circ}-\mathrm{F}_{3}=0$
$\mathrm{F}_{1} \cos 30^{\circ}=\mathrm{F}_{2} \cos 45^{\circ}$
$\mathrm{F}_{1} \sin 30^{\circ}+\mathrm{F}_{2} \sin 45^{\circ}=\mathrm{F}_{3}$
$=0.732 \mathrm{~F}_{3} \quad$ O

$$
\begin{aligned}
& \mathrm{F}_{2}=0.896 \mathrm{~F}_{3} \\
& \mathrm{~F}_{3}=1.00 \mathrm{~F}_{3}
\end{aligned}
$$

## Newton's Laws of Motion

- Newton's first law: If no force acts on a body, then the body's velocity cannot change, that is, the body can not accelerate.
- Newton's second law: The net force on a body is equal to the product of the body's mass and the acceleration of the body $\Sigma \mathrm{F}=\mathrm{m}$ a
- Newton's third law: When two bodies interact, the forces on the bodies from each other are always equal in magnitude and opposite in direction

$$
\mathrm{F}_{\mathrm{AB}}=-\mathrm{F}_{\mathrm{BA}}
$$

Sample problem 5-5.
$\mathrm{M}=3.3 \mathrm{~kg}, \mathrm{~m}=2.1 \mathrm{~kg}$, frictionless surface
H falls as S accelerate to the right
(a) What is the acceleration of $S$ ?

Acceleration a links the two masses together

$$
\mathrm{F}_{\mathrm{g}}=\mathrm{mg}
$$

Forces on $m$

## unbalanced forces on M

$\mathrm{mg}-\mathrm{Ma}=\mathrm{ma}$

$$
\mathrm{a}=\frac{\mathrm{m}}{\mathrm{M}+\mathrm{m}} \mathrm{~g}
$$

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?

How do you set up this problem?

$m_{2}$

Which Coordinate system?
slanted

Easiest because of direction of motion

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?

First set up coordinate system

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?
gravity still points down

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?
gravity still points down

$$
\mathrm{m}_{1} \mathrm{~g}, \mathrm{~m}_{2} \mathrm{~g}
$$

Normal force is perpendicular to the plane

Tension is along the rope

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?

Thus, the free body diagram becomes:

Dissect the forces into components $\mathrm{m}_{1} \mathrm{~g}$
$\overrightarrow{\mathrm{T}}=\mathrm{T} \hat{\mathrm{i}}+0 \hat{\mathrm{j}}$
$\overrightarrow{\mathrm{N}}=0 \hat{\mathrm{i}}+\mathrm{N} \hat{\mathrm{j}}$
$m_{1} \vec{g}=m_{1} g \sin \theta(-\hat{i})+m_{1} g \cos \theta(-\hat{j})$

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?

Thus, the free body diagram becomes:

Disect the forces into components

$$
\begin{aligned}
& \overrightarrow{\mathrm{T}}=\mathrm{T} \hat{\mathrm{i}}+0 \hat{\mathrm{j}} \\
& \overrightarrow{\mathrm{~N}}=0 \hat{\mathrm{i}}+\hat{\mathrm{N}}
\end{aligned}
$$

$\mathrm{m}_{1} \vec{g}=\mathrm{m}_{1} g \sin \theta(-\hat{\mathrm{i}})+\mathrm{m}_{1} g \cos \theta(-\hat{\mathrm{j}})$

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?

Thus, the free body diagram becomes:

Now apply Newton's Second Law

$\mathrm{x}: \quad \sum \mathrm{F}_{\mathrm{xi}}=\mathrm{T}-\mathrm{m}_{1} \mathrm{~g} \sin \theta=\mathrm{m}_{1} \mathrm{a}$
$y: \quad \sum F_{y_{i}}=N-m_{1} g \cos \theta=0$
$\mathrm{m}_{2}: \quad-\mathrm{T}+\mathrm{m}_{2} \mathrm{~g}=\mathrm{m}_{2} \mathrm{a}$

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. What is the acceleration of either mass if the inclined plane is frictionless?

Thus, the free body diagram becomes:

Now apply Newton's Second Law

$\mathrm{x}: \quad \sum \mathrm{F}_{\mathrm{xi}}=\mathrm{m}_{2} \mathrm{~g}-\mathrm{m}_{2} \mathrm{a}-\mathrm{m}_{1} \mathrm{~g} \sin \theta=\mathrm{m}_{1} \mathrm{a}$
$m_{2} g-m_{1} g \sin \theta=\left(m_{1}+m_{2}\right) a$
$a=\frac{m_{2} g-m_{1} g \sin \theta}{\left(m_{1}+m_{2}\right)} \Rightarrow \vec{a}=\frac{m_{2} g-m_{1} g \sin \theta}{\left(m_{1}+m_{2}\right)}(\hat{i})$
$y: N=m_{1} g \cos \theta$

## A Quiz

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. Is the tension in the rope greater than, less than, or equal to $\mathrm{m}_{2} \mathrm{~g}$ ?

$\mathrm{m}_{2} \mathrm{~g}$

1) less than $m_{2} g$ 2) greater than $m_{2} g$ 3) equal to $\mathrm{m}_{2} \mathrm{~g}$ 4) depends on the acceleration $0)$ none of the above

## A Quiz

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. Is the tension in the rope greater than, less than, or equal to $\mathrm{m}_{2} \mathrm{~g}$ ?

$\mathrm{m}_{2} \mathrm{~g}$

1) less than $\mathrm{m}_{2} \mathrm{~g} \quad$ 2) greater than $\mathrm{m}_{2} \mathrm{~g}$
2) equal to $\mathrm{m}_{2} \mathrm{~g}$ $0)$ none of the above

## A Quiz

$$
\begin{aligned}
& m_{2}:-T+m_{2} g=m_{2} a \Rightarrow T=m_{2}(g-a) \\
& a=\frac{m_{2} g-m_{1} g \sin \theta}{\left(m_{1}+m_{2}\right)} \Rightarrow \vec{a}=\frac{m_{2} g-m_{1} g \sin \theta}{\left(m_{1}+m_{2}\right)}(\hat{i})
\end{aligned}
$$

Consider $\mathrm{m}_{1}>\mathrm{m}_{2}$. Is the tension in the rope

$\mathrm{m}_{2} \mathrm{~g}$
4) depends on the acceleration
